Yongxue Xu (Jerry)

Undergraduate researcher at Sun Yat-sen University

Video generation • World models • 4D scene understanding

xuyx85@mail2.sysu.edu.cn • jerrysnow.me • github.com/IamJerryXu

Google Scholar • LinkedIn

Undergraduate researcher working on video understanding, object-centric temporal modeling, and 4D dynamic reasoning. Seeking an industry research internship in multimodal foundation models, video generation, or world models.

Available from October 2026 for 6+ months, through graduation in June 2027.

Education

Sun Yat-sen University

B.Eng. in Intelligent Science and Technology

GPA 3.91 / 4.0 • Major GPA 3.94 / 4.0

SEP 2023 -- JUN 2027

Project 985 / 211 / Double First-Class

Research Experience & Publications

LMM-Track4D: Eliciting 4D Dynamic Reasoning in LMMs via Trajectory-Grounded Dialogue

Chaoyue Li*, Yongxue Xu*, Jie Feng*, and Jiayu Ding[†]

Submitted to NeurIPS 2026; [arXiv:2605.19390](#)

Developed [LMM-Track4D](#) for trajectory-grounded multi-turn dialogue: answering spatiotemporal questions about multi-view videos while predicting query-conditioned 3D object trajectories. Combined geometry-aware encoding, persistent state memory, and structured trajectory decoding; co-developed Track4D-Bench.

Equipped LMMs with 4D dynamic reasoning capabilities. Substantially outperformed the base model on [Track4D-Bench](#) and external benchmarks, especially in dynamics reasoning.

Contribution: Led model design and main experiments; co-developed the benchmark.

Learning to Reason with Persistent Object States for Video Instance Segmentation

Yongxue Xu*, Boxue Yang*, Ziqian Liu, Shaoqiu Zhang, and Linfeng Zhang[†]

Submitted to ICLR 2027

Developed [POSReasoner](#) for video instance and object segmentation, preserving identities as objects become occluded and reappear. Coupled persistent object memory with verified state transitions to prevent ambiguous observations from corrupting identity history.

Improved long-horizon identity continuity and object recovery with the segmentation models frozen.

Delivered consistent gains across evaluated backbones and benchmarks, including occlusion-heavy and long-video settings.

Contribution: Led method and architecture design, implementation, experiments, and manuscript preparation.

TRACE: Typed Reference-Aware Conversational Editing for Humanoid Motion Diffusion

Zejian Kang, Yifu Luo, Boyang Shen, Jingxuan Li, Zekai Chen, Shi Zekun, Yongxue Xu, Zhenyu Hou, Bingqian Wu, Shaolei Zhang, Wentao Yang, and Xiangru Huang

Submitted to ICLR 2027

Contributed to TRACE for multi-turn, language-guided humanoid motion generation and editing. Typed motion programs specify what to change or preserve, while reference-constrained diffusion modifies selected joints and time intervals without regenerating the entire motion.

Contribution: Reproduced baseline methods, adapted evaluators, and converted motion demos for Unitree G1.

Graph Domain Adaptation Does Not End with Representation Learning

Yongxue Xu*, Ziqian Liu*, Enze Zhang, and Maolin Wang†

Submitted to ICLR 2027

Developed [EviGDA](#) for unsupervised graph domain adaptation: transferring node classifiers from labeled source graphs to unlabeled target graphs by fusing graph-aware and feature-only predictions. Surpassed existing state-of-the-art methods in overall graph domain adaptation performance.

Contribution: Designed the core method and led implementation, evaluation, and manuscript development.

Solving the Robust Influence Maximization Problem in Competitive Multilayer Networks via a Diffusion-Aware Role-Guided Evolutionary Approach

Yongxue Xu, Ziqian Liu, Yongqing Huang, and Shuai Wang†

Under review at IEEE Transactions on Network Science and Engineering

Developed [DRCIM-ML](#) for robust seed selection in competitive multilayer networks under node-removal attacks, using diffusion-aware role alignment and cross-layer evolutionary search.

Extended RCIM from single-layer to multilayer networks, with a new formulation and a dedicated solver.

Contribution: Led problem formulation, method design, experiments, and writing; one patent pending.

Identifying Critical Nodes with Deep Learning and Reinforcement Learning: A Case Study on Urban Road Networks

Zhonghan Liu, Wenshuo Liu, Yongxue Xu, Ziqian Liu, Yichen Liu, and Shuai Wang†

GBCESC 2025 / Best Paper Award

Investigated critical-node identification in urban road networks using deep learning and reinforcement learning, combining road-network data construction with comparative evaluation of GNN and DQN approaches.

Contribution: Contributed dataset construction, GNN/DQN baseline reproduction, and experimental visualization.

* Equal contribution. † Corresponding author.

Research Tools

[AstraDraw](#). Developed a reference-guided workflow for editable PowerPoint research figures, reusable visual assets, and iterative local refinement. Used in my own papers; attracted 100+ GitHub stars.

[CCFA-Skills](#). Co-developed with [InkMind.AI collaborators](#): a coordinated toolkit of 17 research skills spanning literature, experiments, writing, figures, review, and submission. Integrated AstraDraw for reference-guided figure authoring.

Research Initiatives & Collaborations

Collaborate with researchers at [HKUST](#), [SJTU](#), and [Westlake University](#) on video generation and multimodal spatiotemporal understanding; explore AI-assisted research with peers in [InkMind.AI](#).

Awards & Competitions

Sun Yat-sen University First-Class Scholarship	2023–2026
Chinese Mathematics Competition (CMC), Guangdong Region – Second Prize	Dec. 2024
Mathematical Contest in Modeling (MCM), USA – Honorable Mention	Feb. 2025
National Undergraduate Smart Car Competition, South China Region – Second Prize	Aug. 2025

Beyond Research: Table tennis, music, and nature travel.
